The Carbon-Land Model Intercomparison Project (C-LAMP)

90

- The Carbon-Land Model Intercomparison Project (C-LAMP) began as a CCSM Biogeochemistry Working Group project to assess model capabilities in the coupled climate system and to explore processes important for inclusion in the CCSM4 Earth System Model for use in the IPCC Fifth Assessment Report (AR5).
- Unlike traditional MIPs, C-LAMP was designed to confront models with best-available observational datasets, develop metrics for evaluation of biosphere models, and build a general-purpose BGC diagnostics package for model evaluation.

Forrest M. Hoffman¹, James T. Randerson², Peter E. Thornto The Carbon-Land Model Intercomparison Project (C-LAMP)

- C-LAMP is a Biogeochemistry Subproject of the Computational Climate Science End Station (Warren Washington, PI), a U.S. Dept. of Energy INCITE Project.
- Models were initially run on the Cray X1E vector supercomputer in ORNL's National Center for Computational Sciences (NCCS). Cray X1E (phoenix)

1024 processors (MSPs), 2048 GB memory, and 18.08 TFlop/s peak DECOMMISSIONED September 30, 2008

C-LAMP Protocol Overview

- Experiment 1: Models forced with an improved NCEP/NCAR reanalysis climate data set (Qian, *et al.* 2006) to examine the influence of climate variability, prescribed atmospheric CO₂, and land cover change on terrestrial carbon fluxes during the 20th century (specifically 1948–2004).
- Experiment 2: Models coupled with an active atmosphere (CAM3), prescribed atmospheric CO₂, prescribed sea surface temperatures and ocean carbon fluxes to examine the effect of a coupled biosphere-atmosphere for carbon fluxes and climate during the 20th century.
- CCSM3.1 partially coupled ("I" & "F" configurations) run at T42 resolution ($\sim 2.8^{\circ} \times 2.8^{\circ}$), spectral Eulerian dycore, $1^{\circ} \times 0.27^{\circ}$ -0.53° ocean & sea ice data models (T42gx1v3).
- Experimental protocol, output fields, and metrics are available at http://www.climatemodeling.org/c-lamp/

C-LAMP, C⁴MIP, and iLEAPS

- C-LAMP Experiment 2 is patterned after C⁴MIP (Coupled Climate-Carbon Cycle Model Intercomparison Project, http://www.c4mip.cnrs-gif.fr/) Phase 1.
- At the October 2006 C⁴MIP Workshop at the UK Met Office in Exeter, there was strong interest in Experiment 1 and validation experiments using Fluxnet observations.
- At the Marie Curie/iLEAPS Workshop in Hyères, a number of modeling groups expressed interest in consistent model validation and model-data comparisons for their coupled biosphere models, but best-available observations from ground and satellite measurements are difficult to manipulate.
- C-LAMP is sharing forcing and observational datasets, and model results are available through the Earth System Grid (ESG), just like for CMIP3 (the IPCC AR4 model results).

	Offline Forcing with NCEP/NCAR Reanalysis							
Exp.	Description	Time Period						
1.1	Spin Up	\sim 4,000 y						
1.2	Control	1798-2004						
1.3	Varying climate	1948-2004						
1.4	Varying climate, CO_2 , and N deposition	1798-2004						
1.5	Varying climate, CO_2 , N deposition and land use	1798-2004						
1.6	Free Air CO ₂ Enrichment (FACE) Control	1997-2100						
1.7	Free Air CO ₂ Enrichment (FACE) Transient	1997–2100						
	Coupled Land-Atmosphere Forcing with Hadley SSTs							
Exp.	Time Period							
2.1	Spin Up	\sim 2,600 y						
2.2	Control	1800-2004						
2.3	Varying climate	1800-2004						
2.4	Varying climate, CO_2 , and N deposition	1800-2004						
2.5	Varying climate, CO ₂ , N deposition and land use	1800-2004						
2.6	Varying climate, CO_2 , N deposition, seasonal FFE	1800-2004						

All but the land use experiments were run with CCSM3.1 using CLM3-CASA' and CLM3-CN biogeochemistry models yielding >16,000 y and ~50 TB

C-LAMP Performance Metrics and Diagnostics

- An evolving draft document on metrics for model evaluation is available at http://www.climatemodeling.org/c-lamp/
- Each model is scored with respect to its performance on various output fields compared with best-available observational datasets.
- Examples include:
 - net primary production (NPP) from EMDI and MODIS
 - leaf area index (LAI) using MODIS spatial distribution and phase
 - CO₂ seasonal cycle (NOAA/Globalview flask sites, after running fluxes through an atmospheric transport model for Experiment 1)
 - regional carbon stocks (Saatchi et al., 2006; Batjes, 2006)
 - carbon and energy fluxes (Fluxnet sites)
 - transient dynamics (β factor, etc.)
- More diagnostic or metric ideas? Please contribute them!

The Carbon-Land Model Intercomparison Project (C-LAMP)

- Comparisons with field observations include net primary production (NPP) from the Ecosystem Model-Data Intercomparison (EMDI).
- Measurements were performed in different ways, at different times, and by different groups for a limited number of field sites.
- Shown here are comparisons of NPP with EMDI Class A observations (Figures a and b) and Class B observations (Figures c and d).

Data provided by NASA Distributed Active Archive Center (DAAC) at ORNL

- Comparisons with satellite "modeled observations" must be made carefully because of high uncertainty.
- This comparison with MODIS leaf area index (LAI) focuses on the month of maximum LAI (phase), a measurement with less uncertainty than the "observed" LAI values.
- C-LAMP accounts for this uncertainty by weighting scores accordingly.
- CLM-CASA' scored 5.1/6.0 while CLM-CN scored 4.2/6.0 for this metric.

Forrest M. Hoffman¹, James T. Randerson², Peter E. Thornton The Carbon-Land Model Intercomparison Project (C-LAMP)

- MODIS net primary production (NPP)
 "observations" have higher uncertainty.
- Comparison with MODIS NPP focuses on correlation of spatial patterns.
- CLM-CASA' scored 1.6/2.0 while CLM-CN scored 1.4/2.0.

- Estimates of carbon stocks are very difficult to obtain.
- This comparison with estimates of aboveground live biomass in the Amazon by Saatchi *et al.* (2006) shows that both models are too high by about a factor of 2.
- Using a score based on normalized cell-by-cell differences, CLM-CASA' scored 5.3/10.0 while CLM-CN scored 5.0/10.0.

- Comparisons with AmeriFlux eddy correlation CO₂ flux tower sites include net ecosystem exchange (NEE), gross primary production (GPP), respiration, shortwave incoming radiation, and latent and sensible heat.
- Shown here is a comparison of CLM-CASA' results with the Morgan Monroe L4 time series data.
- All AmeriFlux data are stored and distributed by ORNL's Carbon Dioxide Information Analysis Center (CDIAC).

Forrest M. Hoffman¹, James T. Randerson², Peter E. Thornton

The Carbon-Land Model Intercomparison Project (C-LAMP)

- Additional field measurement comparisons include the Free Air CO₂ Enrichment (FACE) results, including the ORNL site.
- The Norby *et al.* (2005) synthesis of four FACE site observations suggested "response of forest NPP to elevated $[CO_2]$ is highly conserved across a broad range of productivity, with a stimulation at the median of $23 \pm 2\%$."
- A C-LAMP experiment was added to test this result by increasing [CO₂] to 550 ppmv in 1997.

	Lon	Lat	Observa	ations		CASA'			CN	
Site Name	(°E)	(° N)	NPP↑	β_L	NPP↑	β_L	Score	NPP↑	β_L	Score
Duke	-79.08	35.97	28.0%	0.69	16.4%	0.41	0.26	6.2%	0.15	0.65
Aspen	-89.62	45.67	35.2%	0.87	15.6%	0.39	0.39	12.4%	0.31	0.48
ORNL	-84.33	35.90	23.9%	0.59	17.3%	0.43	0.16	5.2%	0.13	0.64
POP-Euro	11.80	42.37	21.8%	0.54	20.0%	0.49	0.04	5.7%	0.14	0.59
	4 sit	e mean	27.2%	0.67	17.3%	0.43		7.4%	0.18	
			Total M	Score			0.79			0.41

But! Norby is now reporting reduced NPP enhancement at the ORNL FACE site due probably to N limitation!

Abstract

With representation of the global carbon cycle becoming increasingly complex in climate models, it is important to develop ways to quantitatively evaluate model performance against *in situ* and remote sensing observations. Here we present a systematic framework, the Carbon-LAnd Model Intercomparison Project (C-LAMP), for assessing terrestrial biogeochemistry models coupled to climate models using observations that span a wide range of temporal and spatial scales. As an example of the value of such

Recent Progress

- C-LAMP drove the development of model improvements in the terrestrial biogeochemistry models for the Community Land Model verison 4 (CLM4).
- Subsequent C-LAMP analyses of six model configurations using CLM3.6 (a pre-release version of CLM4) with CASA' and CN demonstrated better performance by CN.
- Therefore, the CLM4 release will include CN. That configuration will probably be called CLM4-BGC.
- CLM4-BGC will be part of the Community Climate System Model version 4 (CCSM4), which may be called the Community Earth System Model (CESM). This model will be used for IPCC AR5 simulations.
- The physical models for CCSM4 are expected to be finalized before the end of 2009, and the full ESM configuration will follow within six months.

Future Directions

- Working with both observational data centers and Earth System Grid centers, we hope to automate retrieval and processing of both the observational datasets and model results, and provide a web-based diagnostics interface for modelers.
- Participate in the development of an International Land Model Benchmarking (iLAMB) activity, formulating experiments, metrics, and diagnostics for detailed comparison of land/biosphere models for the IPCC Fifth Assessment Report (AR5). The first international meeting was held in June (Exeter, UK); follow-up meetings are planned in conjunction with GEWEX/iLEAPS in August (Melbourne, Australia), with ICDC8 in September (Jena, Germany), and in Spring 2010 (California, USA).
